

Project Pronghorn 🦌 — AI-Powered Enterprise App Generator

Customer: Government of Alberta.
3,400+ repos (growing to 7,000+)

GovAlta built Pronghorn on a startup stack - Lovable for UI, Supabase for DB, Render.com for hosting, with hand-rolled agent orchestration calling Google Gemini & Anthropic Claude directly.

❌ Original Stack	⚠️ Enterprise Risk
Direct Gemini / Claude API calls	Data leaves org boundary, no audit trail
Hand-rolled agent prompt chains	Fragile, unobservable, no execution framework
Lovable + Supabase + Render.com	No data residency, no SLA, vendor lock-in
No security tooling	Zero vulnerability scanning or governance

✅ Enterprise Stack	🏆 Benefit
GitHub Copilot SDK	Managed agent orchestration, encrypted, auditable
Sandbox org isolation	Zero blast radius to 3,400+ production repositories
GitHub Advanced Security + Dependabot	Automated security and policy enforcement day one
Azure Container Apps	Canadian data residency, enterprise SLA
Azure Entra ID	SSO, Managed Identity, fine-grained RBAC
Bicep IaC + GitHub Actions	Repeatable infra, OIDC CI/CD, no stored secrets

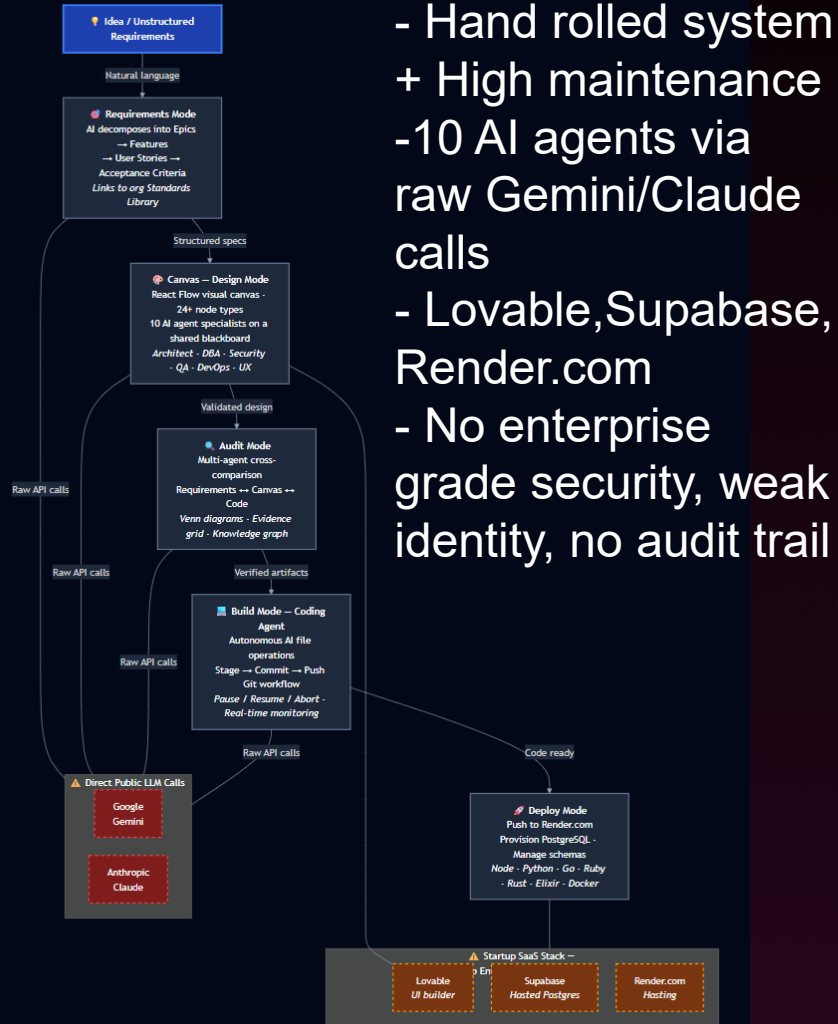

📊 Quantified Impact (Before → After)

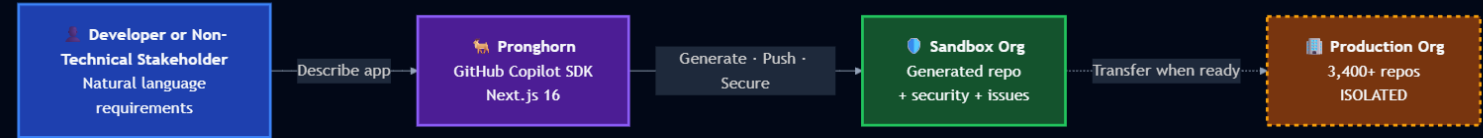

Metric	Before	After
Time to scaffold	Days	Minutes
Blast radius	All 3,400+ repos	Zero
Security config	Manual, ad-hoc	Automated, day one
Agent framework	Hand-rolled LLM calls	Copilot SDK-managed runtime
Data residency	US-based SaaS	Azure Canada Central

Architecture — From Startup Stack to Enterprise Grade

✗ Original: Startup Stack

✓ Enterprise: GitHub Copilot SDK + Azure

- Copilot SDK managed agent sessions
- Sandbox org
- GHAS + Dependabot
- Azurification of generation of apps
- 8 specialized Copilot agents
- No rebuilding of the wheel (many wheels)
- Enterprise grade security & patterns
- Lower maintenance costs

🕒 Planned: WorkIQ integration to enrich requirements with M365 context (emails, meetings, Teams, docs).
